

which items, for various reasons, cannot be approved. In addition, the shipyard is granted an allotment of money from the type commander's repair funds to cover the work authorized. About 30 to 45 days before the start of the overhaul, the type commander's report reaches the yard. The yard is then ready for its own advance planning.

Shipyard planners and estimators go over your ship's work requests to determine what replacement parts and other material will be needed. Orders go out for the yard's Supply Department to obtain the needed parts. For parts it doesn't have at its finger tips, the Supply Department must go to a Naval Supply Center or direct to the manufacturer. This is where the little details in your work requests pay off. They tell the yard exactly how much of what to order.

While such parts are being run down, other shipyard planners pore over various plans and instructions to determine the best way to tackle the trickier jobs. Next, they prepare "job orders" which tell the various shops of the yard what must be done to accomplish each job. Naturally, the question of funds arises here. Estimates of costs are made to show how much of the repair funds will be needed for each job—and how many jobs can be undertaken within the funds granted.

All this is "upstairs work." It is vitally important paperwork that you, as a shipboard sailor, are probably little aware of. But it is advance planning like this that pays dividends in the form of a fast and thorough overhaul.

Shortly before your ship enters the yard, you'll notice certain signs. For example, provisions are allowed to run low and storerooms carry less than their usual amount. This is done to provide elbow room in the storerooms. Ammunition is removed too—it would be dangerous to have it aboard during overhaul.

Your ship arrives at the shipyard and moors to the pier. By the time you get topside, steam lines, water lines, air lines and electric power lines have been run to the ship. Most of the ship's machinery is secured. The only machinery that is left running is what will be tested or used for tests, or perhaps both. The brow is scarcely in place before shipyard planners, design draftsmen and shipworkers stride on board to acquaint

themselves firsthand with the numerous jobs to be undertaken.

To smooth the way for quick work, an arrival conference is held. In this conference, your ship's officers meet with shipyard planning officials. Work requests are discussed. Together they clinch what work will be undertaken and iron out vague points in the work requests.

After the arrival conference the ship becomes the baby of the yard's production department. It is up to this key department to complete the work within the time—and the funds—allotted. To see that this happens, a ship superintendent is assigned to your ship. He is a naval officer and he acts as liaison between your ship and the shipyard on all points of the overhaul. He also acts as coordinator between the shops and "trades" involved in your ship's overhaul.

Now workmen come aboard in a flood, each workman intent upon fulfilling some part of a job order. In the more advanced stages of an overhaul it is not unusual for a destroyer

to have 350 or 400 shipyard workers on board at one time.

These skilled workmen represent a variety of yard shops ashore. Don't let that word "shop" fool you though—some shops are gigantic. At the San Francisco yard, for example, one steel shop covers almost five acres. Constructed at a cost of \$4,000,000 it can accommodate 18,000 shipfitters, welders and boilermakers working together on three shifts. A feature of this shop, incidentally, is the mightiest steel press west of Pittsburgh, Pa.

The many shops of a shipyard, along with the various office buildings, store houses and laboratories form its busy "back yard." There are buildings and shops galore at a typical shipyard. The New York yard, for example, has about 260, the Pearl Harbor yard has about 310 and the Norfolk yard, about 350. Some of these buildings, of course, are up in the "front yard," the waterfront area.

Some typical shops that will be called upon during your overhaul are the: Paint Shop, Pattern Shop, Op-

SKILLED workmen push and pull to install repaired and rebalanced propeller on USS Lewis Hancock, (DD 675). This work is done by the 'Riggers' Shop.'
